Hiring Team
[Company Name]

Dear Hiring Team,

I am writing to apply for the Backend Software Engineer position at [Company Name]. Your team builds AI products on Python and Django REST Framework – the stack I work in daily – and the role's emphasis on scalable REST APIs, relational data modeling, and automated testing lines up closely with how I have spent the last two years.

At Opream, I build and maintain Python/Django REST Framework services on PostgreSQL: model and serializer design, viewsets with role-based permission classes, token authentication, and ORM query tuning behind versioned REST endpoints. More broadly, I have designed and shipped 50+ RESTful API endpoints across five production platforms in a 10+ engineer team, owning each feature from the API contract and relational schema through testing and release. That ownership is the part of the job I care most about: an endpoint is not finished when it returns 200, but when its data model, failure modes, and tests hold up under real traffic.

Scalability for me starts at the database. I have cut query latency by normalizing schemas, writing and optimizing complex SQL, adding targeted indexes, and eliminating N+1 patterns, and I cover critical paths with pytest and Jest unit and integration tests. I work in Linux and develop against Dockerized services, with Nginx and Gunicorn serving Django in deployment, and I use Git and pull request review as the place where defects get caught early. My foundations come from a Computer Science degree, the ITI Python track – where I built Django REST Framework APIs over a normalized PostgreSQL schema designed for 10,000+ users – and competitive programming with ECPC, which is still the best training I have had in reasoning about complexity and edge cases.

I have not yet worked on machine learning systems directly, but I have built the kind of infrastructure they depend on – data ingestion pipelines, integration APIs, and schemas designed for scale – and I would be glad to be the engineer who makes a data science team's models reachable, fast, and reliable in production. I would welcome the chance to discuss how I could contribute to [Company Name]'s engineering team. Thank you for your time and consideration.

Sincerely,
Nizar Esmat Fawzy
